

SECURING THE PHILIPPINES ENERGY FUTURE

THE ENERGY CRISIS

By May 2026, the Philippines' reliance on foreign oil imports has reached a breaking point, paralyzing key economic sectors.

- Limited domestic production falls
- Unprecedented fuel price volatility strains transport, agriculture, and power generation

CURRENT LANDSCAPE

Previous strategies provide relief but are insufficient for long-term sustainability.

- ACTION: Increased domestic exploration and refining capacity.
- LIMITATION: Resources are finite; exploration takes a decade; still vulnerable.

METHODOLOGY & IMPLEMENTATION

- Streamline licensing for solar, wind, and geothermal
- Complete the national grid modernization for variable energy.
- Roll out smart metering and building energy standards.
- Integrate utility-scale battery and pumped-hydro storage systems.

CONCLUSION

The Philippine Energy Security Initiative ensures stability and prosperity for all Filipinos. Energy sovereignty allows focus on growth and development, not crisis management. Creating a future-proof, clean economy and green jobs.
